

The 3-in-1 lock cylinder

Change the access
permission with a
turn of the hand

Whether you work for a residential building company or are a private consumer, your security is in your hands.

With the BAZ cylinder from dormakaba you can easily revoke access permission from various keys or a key group using the changing key. You can carry out this process twice.

So it does not matter if you would like to take away access from a certain person or if you have lost a key – you respond flexibly without having to replace the lock cylinder.

For a construction project that runs smoothly

From before the start of a construction project until the finished product can be used, craftsmen, architects, building contractors and tenants need access, among others. Depending on the stage of the building process, it used to be that locks would have to be replaced or architectural cylinders would have to be used, until now.

You can install the BAZ cylinder as early as during the construction phase and distribute keys to the craftsmen and future tenants. After the construction phase, the access permissions for the craftsmen's keys or key group can then easily be revoked using the changing key.

Benefits for residential building companies

- Cost reduction
- Reduced need to replace master key systems
- Less administrative work
- Early availability of master key system
- Flexible combination with additional features
- Possible to change cylinder code up to two times

For a secure home

Whether it has been because of a hectic day or maybe your child not paying attention: keys are often lost. The result is a security risk to your home and the next logical step is replacing the master key system.

For this case, the BAZ cylinder from dormakaba provides a quick solution. Thanks to the changing key, you can disable access permissions for the lost key group up to two times. This way you hold the security of your property in your own hands and can react quickly if needed, with a simple turn of the hand.

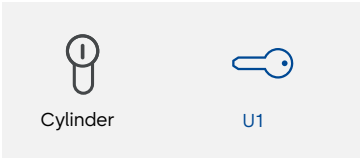

Benefits for home owners/flat owners

- Cost reduction
- Reduced need to replace key systems
- Ability to react after losing a key
- Control over your key system
- Increased security
- Possible to change cylinder code up to two times

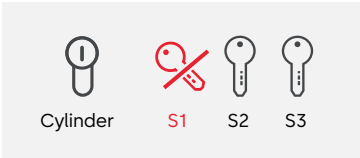

How does the BAZ cylinder work?

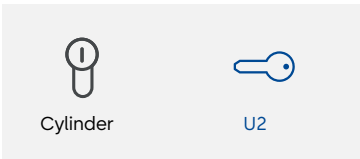

All keys have access permission

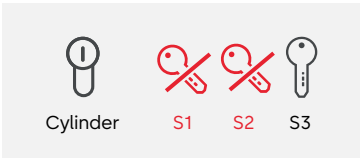

Changing key U1 is used: Pin combination is modified in the cylinder

S1 had its access permission revoked

Changing key U2 is used: Pin combination is modified in the cylinder

S1 and S2 no longer have access permission

Would you like to take security into your own hands?
